## Exam I Review Questions Dr. J. Pinkney

## 1 The Night Sky

| 1.1 | Relative | Sizes. | Powers | of 10. | and | Units |
|-----|----------|--------|--------|--------|-----|-------|

| 1. | How many orders of magnitude does "100 times" correspond to?  |
|----|---|
|    | (a) 10 (b) 100 (c) 1 (d) 2  |
| 2. | T or F. The video "Powers of 10" has nothing to do with cosmology.  |
| 3. | T or F. The nearest star to the Sun is about 10 times farther away than Pluto.  |
| 4. | We can express the average distance between the Earth and Sun in miles $(9.3 \times 10^7 \text{ miles})$ , but it is more convenient to use the unit called the                           |
|    | (a) meter (b) km (c) light year (d) astronomical unit (e) parsec  |
| 5. | How many orders of magnitude are there between the size of a tree and the size of Pluto's orbit?  |
|    | (a) 0 (b) 2 (c) 10 (d) 12   |
| 6. | How many orders of magnitude are there between the size of Pluto's orbit and the scale of superclusters?  |
|    | (a) 1 (b) 5 (c) 12 (d) 15   |
| 7. | (2pt) Answer at least two of the following from the "Powers of 10" video.   |
|    | (a) the largest scale shown, in meters  (b) the smallest scale shown, in meters  (c) the ratio of the largest to the smallest scale  (d) the thing that was about 2 light-seconds across? |
| 8. | (2pts) Put these objects in order from smallest to largest:   |
|    | <ul><li>(a) a cluster of galaxies</li><li>(b) the Milky Way</li><li>(c) human being</li><li>(d) Earth</li></ul>   |
|    | (e) a supercluster of galaxies  |
|    | (f) a neutron star  |

| 9.  | (2pts) Put these things in order from smallest to largest:   |
|-----|--|
|     | <ul> <li>(a) the distance between stars</li> <li>(b) a supercluster of galaxies</li> <li>(c) radius of Neptune's orbit</li> <li>(d) human being</li> <li>(e) distance to Sun</li> <li>(f) Cosmic Microwave Background</li> </ul> |
| 10. | What unit is most convenient for measuring distances between planets?  |
|     | (a) the meter (b) the kilometer (c) the Astronomical unit (d) the light-year   |
| 11. | The mass of the Sun is about $10^{27}$ tons, and that of the Earth is about $10^{22}$ tons. By how many orders of magnitude do these masses differ?  |
|     | (a) 100,000 (B) a million (C) 1000 (D) 2 (E) 5   |
| 12. | What is the average distance in miles between the Sun and Earth using scientific notation?   |
|     | (a) $9.3 \times 10^7$ (B) $9.3 \times 10^6$ (C) $9 \times 10^5$ (D) $9 \times 10^6$ (E) $93,000,000.0$   |
| 13. | What unit is the most practical for measuring distances between galaxies?  (a) the astronomical unit (AU) (b) the parcsec (pc) (c) the light year (LY) (d) the kilometer (km) (e) the megaparsec (Mpc)                           |
| 14. | What unit is the most practical for measuring distances between planets in the solar system?   |
|     | (a) AU (b) pc (b) LY (b) km (b) Mpc  |
| 15. | What unit is the most practical for measuring distances to nearby stars?  (a) the light year (b) the Astronomical Unit (c) the micrometer (d) the kilometer (e) the meter  |
| 16. | The height of an adult human is about $10^x$ meters, where $x = \underline{\hspace{1cm}}$  |
|     | (a) -2 (b) 0 (c) 1 (d) 2 (e) 5   |
| 17. | Write this number in scientific notation: $2,540,000 = $   |
| 18  | Write this number in scientific notation: $93 \times 10^6 =$   |

| 1.2 | Naked   | Eve | Universe.    | Constellatio | ns  |
|-----|---------|-----|--------------|--------------|-----|
| T.  | 1 tanca | ,   | CIII V CI DC | Composition  | 11, |

| 19. | T or F. All of the constellation names originated with the ancient Greeks (roughly 600-0 BC).  |  |  |  |
|-----|--|--|--|--|
| 20. | T or F. Other than the Milky Way, no galaxies are visible to the naked eye from Earth.   |  |  |  |
| 21. | T or F. Some stars belong to two or more asterisms.  |  |  |  |
| 22. | T or F. The time to go from Full Moon to third quarter is about 1 week.  |  |  |  |
| 23. | The Moon rises at about 6 pm when it is in its phase.  |  |  |  |
| 24. | The four extra minutes in the solar day compared to the sidereal day are due to our around the Sun.  |  |  |  |
| 25. | (1pt) Name one of the asterisms in the Constellation Taurus.   |  |  |  |
| 26. | Which constellation contains the asterism known as the "Big Dipper"?   |  |  |  |
|     | (a) Ursa Minor (b) Ursa Major (c) Canis Minor (d) Canis Major (e) Orion  |  |  |  |
| 27. | Which of these planets is always fainter than Sirius?  |  |  |  |
|     | (a) Mercury (b) Venus (c) Mars (d) Jupiter (e) Saturn  |  |  |  |
| 28  | The Big Dipper is a(n) located in the called Ursa Major.   |  |  |  |
|     | <ul> <li>(a) constellation, sky</li> <li>(b) constellation, asterism</li> <li>(c) asterism, constellation</li> <li>(d) asterism, star cluster</li> </ul> |  |  |  |
| 29. | Which planet is the brightest as seen from Earth? (Don't include Earth, and just consider maximum brightnesses. )  |  |  |  |
| 30. | What is the brightest star in the nighttime sky?   |  |  |  |
| 31. | What is the brightest star in the sky?   |  |  |  |
| 32. | Ancient skywatchers concluded that the stars were attached to a, a canopy of stars resembling an astronomical painting.                                  |  |  |  |
|     | (a) celestial sphere   |  |  |  |
|     | (b) night sky  |  |  |  |
|     | (c) daytime sky  |  |  |  |
|     | (d) astronomical twilight  |  |  |  |

| 33. | How               | many                           | constellatio                                     | ns are ther   | ·e?                                    |                 |                              |  |
|-----|-------------------|--------------------------------|--|---------------|--|-----------------|------------------------------|--|
|     | (a)               | 23                             | (b)6500  | (c) 78        | (d) 88                                 | (e) 90          |                              |  |
| 34. | Wha               | it is the                      | e name of tl                                     | he planetar   | ium progra                             | m that Pinkney  | keeps telling                | you to get?                                  |
| 1.3 | Ce                | elestia                        | al Sphere  | e, Navig      | cation, Se                             | easons, Coo     | ordinates                    |  |
| 35. |                   |                                | esent the d                                      |               |  | that can show a | rising and sett              | ting motions but it                          |
|     | (b)<br>(c)<br>(d) | night s<br>celestia<br>astrono | al pointer sky al equator omical twili al sphere | ${ m ght}$    |  |                 |                              |  |
| 36. | If on             | e trave                        | ls along a l                                     | ine of equa   | l latitude, t                          | hey will change |                              |  |
|     | (a)               | ting, a                        |  | ng (c) t      | he altitude                            | - ,             |                              | objects rising, set-<br>t which objects rise |
| 37. | If on             | e trave                        | ls along a l                                     | ine of equa   | l longitude,                           | they change ev  | erything except              | pt   |
|     | (a)               | set                            |  | ne at which   |  | ~               |                              | nost object rise and which objects rise      |
| 38. | Whi               | ch of th                       | nese is not o                                    | directly lind | ked to prece                           | ssion?          |                              |  |

|     | (a)               | celesti<br>ian                 | al sphere  | (b) celest    | tial equator                           | (c) zenith      | (d) nadir                    | (e) celestial merid-                         |
| 40. | A pr              | •                              | n of the lin                                     | e of longit   | ude on whic                            | ch you stand or | nto the celestic             | al sphere would be                           |
|     | (a)               | celesti<br>ian                 | al sphere  | (b) celest    | tial equator                           | (c) zenith      | (d) nadir                    | (e) celestial merid-                         |

| 41. | A line that includes the south cardinal point on your horizon and the point overhead is your celestial   |
|-----|--|
|     | (a) meridian (b) equator (c) zenith (d) nadir (e) sphere   |
| 42. | Imagine viewing the Sun from ONU and seeing it above the western horizon. In which way will it move in the hour to come?                                       |
|     | (a) down and to the right (b) straight down (c) down and to the left (d) up and to the right (e) up and to the left  |
| 43. | Imagine viewing the Sun from ONU and seeing it above the eastern horizon. In which way will it move in the hour to come?                                       |
|     | (a) down and to the right (b) straight down (c) down and to the left (d) up and to the right (e) up and to the left  |
| 44. | The annual oscillation of average temperatures which we call seasons is caused by two main factors: 1) the varying directness of the Suns rays at noon, and 2) |
|     | (a) the varying distance of the Earth from the Sun   |
|     | (b) the varying length of daylight hours   |
|     | (c) the varying distance of the Moon from the Earth  |
|     | (d) the varying tilt of the Earth relative to the ecliptic   |
|     | (e) the changing orientation of the Earth-Moon line of nodes   |
| 45. | Imagine standing on the Earth's equator and viewing the Sun above the western horizon. In which way will it move in the hour to come?                          |
|     | (a) down and to the right (b) straight down (c) down and to the left (d) up and to the right (e) up and to the left  |
| 46. | At which latitude on Earth do stars and planets appear to rise perpendicular to the horizon?   |
|     | (a) $90^{\circ} \text{ S}$ (b) $90^{\circ} \text{ N}$ or $90^{\circ} \text{ S}$ (c) $45^{\circ} \text{ N}$ (d) $0^{\circ}$                                     |
| 47. | The countries north of $23.5^{\circ}$ latitude receive the most energy from the Sun around June 21 because that is when  |
|     | (a) the Sun is closest to Earth (b) the sunlight is most direct (c) the length of daytime is longer (d) both (b) and (c) (e) none of the above                 |
| 48. | (2pts) The Northern Hemisphere receives the most energy from the Sun on June 20 or 21 because that is when . (Circle all that apply.)                          |

|     | (a) the Sun is closest to Earth (b) the Sun burns the hottest (c) the sunlight is most direct (d) the length of daytime is longer (e) the cloud tops are most reflective                |
|-----|---|
| 49. | (2pts) Precession of the equinoxes leads to (Circle more than one.)   |
|     | (a) the change of stellar coordinates with time   |
|     | (b) the blue color of the sky   |
|     | (c) the changing separation of Polaris from the North Celestial Pole  |
|     | (d) the daily tides   |
|     | (e) the westward motion of the vernal equinox   |
| 50. | The location - independent coordinate system based on the celestial equator has the coordinates $\frac{1}{2}$   |
|     | (a) Right Ascension and Altitude (b) Altitude and Azimuth (c) Azimuth and Declination (d) Right Ascension and Declination (e) Up-down and side-to-side                                  |
| 51. | The location-dependent line on the celestial sphere which is used to define the altitude-azimuth coordinate system is the:  |
|     | (a) prime meridian (b) central meridian (c) celestial equator (d) ecliptic (e) horizon  |
| 52. | At which latitude on Earth do stars appear to move parallel to the <b>celestial equator</b> ?   |
|     | (a) $90^{\circ}$ S (b) $90^{\circ}$ N or $90^{\circ}$ S (c) $45^{\circ}$ N (d) $0^{\circ}$ (e) All latitudes  |
| 53. | A circumpolar star, as seen from the Northern hemisphere,   |
|     | (a) rotates counterclockwise about the North Celestial Pole (b) rises once per day (c) sets only once per day (d) rotates clockwise about the N. C. Pole (e) makes a strait star-trail. |
| 54. | The Celestial globe correctly models the angular separations between stars, but it fails to model   |
|     | (a) the height of stars above the horizon (b) the distances to stars (c) the altitude of stars (d) the right ascension of stars (e) the azimuth of stars.                               |
| 55. | At least how many coordinates must be given to specify the position of a star on the celestial sphere?  |
|     | (a) 0 (b) 1 (c)2 (d) 3 (e) $4.0$  |

equator and its right ascension zeropoint on the

56. The equatorial (or "celestial") coordinate system has its declination zeropoint on the celestial

|     | (a) north celestial pole (b) vernal equinox (c) autumnal equinox (d) celestial meridian (e) Greenwich line of longitude  |
|-----|--|
| 57. | The projection of lines of longitude onto the Celestial Sphere are lines of equal  |
|     | (a) Declination (b) azimuth (c) right ascension (d) altitude (e) arclength   |
| 58. | You are lost in the woods and you see that Polaris is $40^{\circ}$ away from the $zenith$ . From this you can tell that you are  |
|     | (a) south of the equator (b) at latitude 50° N (c) at latitude 40° N (d) 40° West of Greenwich (e) 50° from the North magnetic pole.   |
| 59. | You are lost in the woods and you see that Polaris is $30^\circ$ away from the horizon. From this you can tell that you are  |
|     | <ul> <li>(a) south of the equator</li> <li>(b) at latitude 60° N</li> <li>(c) at latitude 30° N</li> <li>(d) 30° West of Greenwich</li> <li>(e) 60° from the North celestial pole.</li> </ul>  |
| 60. | The Moons of which planet were used as a timepiece by Ole' Roemer?   |
|     | (a) Jupiter (b)Saturn (c)the morning star (d)Mercury (e)Mars   |
| 61. | Right ascension is measured on a scale from 0 tohours.   |
|     | (a) 360 (b)180 (c)24 (d)12 (e)90   |
| 62. | Declination is measured on a scale fromdegrees.  |
|     | (a) 0 to 180 (b) -90 to 90 (c) 0 to 90 (d) 0 to 360 (e) 1 to 100   |
| 63. | The equation of time tells you   |
|     | (a) the difference between your time and Universal Time (b) what the time "back home" is (c) the difference between apparent solar time and mean solar time (d) the difference between mean solar time and sidereal time (e) your time zone, given your longitude. |
| 64. | Our current calendar is based on the   |
|     | (a) sidereal year (b) Good Year (c) tropical year (d) anomalistic year (e) Far Side  |
| 65. | The leap year system was developed because   |
|     | (a) Caesar wanted to keep his country on its toes (b) Pope Gregory wanted to keep his country on its toes (c) there is not an integer number of days in the year (d) the length of the year is <i>exactly</i> 365.25 solar days (e) February was hurtin' for days  |

| 66. On which latitude on Earth do stars and planets appear to rise perpendicular to the horizon?  |
|---|
| (a) $90^{\circ} \text{ S}$ (b) $90^{\circ} \text{ N}$ or $90^{\circ} \text{ S}$ (c) $45^{\circ} \text{ N}$ (d) $0^{\circ}$                              |
| 67. The coordinates which depend on your location and use the horizon as a reference point are  |
| (a) Right Ascension and Altitude (b) Altitude and Azimuth (c) Azimuth and Declination (d) Right ascension and Declination                               |
| 68. Right Ascension is measured on a scale from 0 to hours.   |
| (a) 360 (b) 60 (c) 24 (d) 12 (e) infinity   |
| 69. What are the altitude and azimuth of a star or planet which has a declination of $0^{\circ}$ and is just rising in the East?                        |
| (a) 0 and 90 degrees (b) 90 and 180 degrees (c) 0 and 180 degrees (d) 10 and 0 degrees  |
| 70. What do we call the path of the Sun along the celestial sphere?   |
| (a) the celestial equant (b) the ecliptic (c) the celestial equator (d) the celestial meridian (e) the prime meridian                                   |
| 71. If your latitude is 30°N, then stars with a declination greater thanwould be circumpolar.   |
| (a) $30^{\circ}$ (b) $-30^{\circ}$ (c) $60^{\circ}$ (d) $-60^{\circ}$ (e) $45^{\circ}$  |
| 72. Which long-period phenomenon is caused by the pull of the Moon and Sun on the Earth's equatorial bulge?   |
| (a) tug of war (b) lunar tides (c) precession (d) eclipses (e) earthquakes  |
| 73. The Earth is about how many times larger than the Moon (in diameter)?   |
| (a) 4 (b) 10 (c) 45 (d) 110 (e) 400   |
| 74. Lunar eclipses only occur during the hours surrounding the moment of  |
| (a) New Moon (b) 1st quarter (c) Full Moon (d) 3rd quarter (e) waxing gibbous   |
| 75. What conditions will lead to an annular solar eclipse? (Each choice is a lunar phase, a position on the sky, and the Moon's position in its orbit.) |
| (a) new moon crossing celestial equator during apogee   |

|     | (c) full moon crossing ecliptic during perigee  |
|-----|---|
|     | (d) new moon crossing ecliptic during perigee   |
|     | (e) new moon crossing ecliptic during apogee  |
| 76. | At about what time does the moon rise when its phase is new moon?   |
|     | (a) $6 \text{ am}$ (b) $12 \text{ pm}$ (c) $6 \text{ pm}$ (d) $12 \text{ am}$ (midnight) (e) $9 \text{ am}$                                       |
| 77. | Which is longer, the sidereal month (time it takes Moon to line up with the stars) or the synodic month (time to line up with the Sun)?           |
|     | <ul><li>(a) sidereal</li><li>(b) synodic</li><li>(c) celestial</li><li>(d) a and b are the same</li><li>(e) the Moon does not rotate!</li></ul>   |
| 78. | How does the Moon's orbital plane relate to the plane containing the Earth's orbit around the Sun?  |
|     | (a) they are coincident (the same)  |
|     | (b) they are parallel   |
|     | (c) they intersect at a 5° angle  |
|     | (d) they intersect with a 23.5° angle   |
|     | (e) they are perpendicular  |
| 79. | (2pts) Viewed from the Northern Hemisphere, a circumpolar star (Circle more than one.)  |
|     | (a) circles CCW about Polaris   |
|     | (b) rises and sets only once per day  |
|     | (c) never rises or sets   |
|     | (d) circles CW about Polaris  |
|     | (e) proves that the Earth is rotating   |
| 80. | What is the angle between the S cardinal point and your zenith?   |
| 81. | On which days of the year is the length of the day 12 hours for virtually all latitudes? (Give the names of those days or the approximate dates.) |
| 82. | How many arcseconds in a degree?  |

(b) full moon crossing celestial equator during perigee

| 83. | In what units is right ascension measured?   |
|-----|--|
| 84. | What range of declinations does the Sun cover throughout the year?   |
| 85. | About how many degrees does the Sun move each day relative to the stars?   |
| 86. | What is the declination of the NCP?  |
| 87. | For people on the north pole, the entire horizon has a declination of degrees.   |
| 88. | How many constellations are there in the entire celestial sphere?  |
| 89. | Which constellation contains both the Pleiades and a bull asterism?  |
| 1.4 | Historical Astronomy   |
| 90. | The most accurate model used by the Greeks to explain planetary motion was that of:  |
|     | (a) Aristotle.   |
|     | (b) Pythagoras.  |
|     | (c) Hipparchus.  |
|     | (d) Ptolemy.   |
|     | (e) Erastothenes.  |
|     | (a) Tenochtitlan (b) Caracol (c) Stonehenge (d) Montezuma's revenge (e) the Colloseum                                      |
| 91. | The astronomical observatory/temple built by the Mayan's is called   |
|     | (a) the Big Horn Medicine Wheel  |
|     | (b) Caracol  |
|     | (c) Stonehenge   |
|     | (d) the Colloseum  |
|     | (e) Quetzaquatl  |
| 92. | T or F. It was the Chinese who provided critical ancient records of supernovae and comets.                                 |
| 93. | T or F. Like the Sun and the Moon, the planets usually move from west to east (rel to the stars) from one day to the next. |

| 94.  | T or F. Aristarchus's heliocentric view was shared by the majority of Greek philosophers.   |  |  |  |  |
|------|---|--|--|--|--|
| 95.  | T or F. Galileo's observations of stellar parallax were proof Copernicus was correct.   |  |  |  |  |
| 96.  | Eratosthenes reasoned that the ratio of $7.2^{\circ}$ to $360^{\circ}$ is the same as the ratio of the distance between Syene and Alexandria to the |  |  |  |  |
|      | (a) radius of the Earth (b) circumference of the Earth (c) distance to the Moon (d) diameter of the Earth (e) distance between the Earth's poles    |  |  |  |  |
| 97.  | Which culture thought Ptolemy was the "greatest" and built on his work after 200 AD?  |  |  |  |  |
|      | (a) Chinese (b) Mayan (c) Babylonian (d) Arab (e) Greek   |  |  |  |  |
| 98.  | The heliocentric model was actually first proposed by:  |  |  |  |  |
|      | (a) Aristotle. (b) Archimedes. (c) Aristarchus. (d) Alexander the Great. (e) Hipparchus.  |  |  |  |  |
| 99.  | The apparent change in position of an object caused by the motion of the observer is called   |  |  |  |  |
|      | (a) parallax (b) syzygy (c) betelgeuse (d) parsec (e) feedback  |  |  |  |  |
| 100. | The Ptolemaic model of the universe:  |  |  |  |  |
|      | (a) explained and predicted the motions of the planets with deferents and epicycles.  |  |  |  |  |
|      | (b) is the basis of our modern cosmology.   |  |  |  |  |
|      | (c) could not account for the stellar parallax observed by Hipparchus.  |  |  |  |  |
|      | (d) describes the orbits of the planets as being ellipses, not circles.   |  |  |  |  |
|      | (e) always kept Mars and Mercury between the Earth and Sun.   |  |  |  |  |
| 101. | Which of these was NOT a part of Ptolemy's model?   |  |  |  |  |
|      | (a) Mercury must always lie roughly between the Earth and Sun.  |  |  |  |  |
|      | (b) It was geocentric.  |  |  |  |  |
|      | (c) Eastward motion of the planet was along the deferent.   |  |  |  |  |
|      | (d) Retrograde motion of the planet utilized the epicycle.  |  |  |  |  |
|      | (e) Both Venus and Jupiter would be brightest at opposition.  |  |  |  |  |
| 102. | The inferior planets differ from the superior ones in that  |  |  |  |  |
|      | (a) they are limited in their angular separation from the Sun   |  |  |  |  |
|      | (b) they twinkle  |  |  |  |  |
|      | (c) they vary in brightness   |  |  |  |  |
|      | (d) they are actually in motion around the Sun  |  |  |  |  |

|      | (e)  | they show no r   | etrograde motion                         |                 |                               |                                |     |  |
|------|--|--|--|-----------------|-------------------------------|--------------------------------|-----|--|
| 103. | Which of the statements below is part of both the Ptolemaic and Copernican models?   |  |  |                 |                               |                                |     |  |
|      | (a) The Earth orbits the Sun once a year.  |  |  |                 |                               |                                |     |  |
|      | (b) The Sun lies in the center of the Cosmos.  |  |  |                 |                               |                                |     |  |
|      | (c) The Moon orbits the Earth once a month.  |  |  |                 |                               |                                |     |  |
|      | (d) Epicycles are needed to explain retrograde motion of the planets.  |  |  |                 |                               |                                |     |  |
|      | (e) Venus' epicycle must always lie between us and the Sun.  |  |  |                 |                               |                                |     |  |
| 104. | On which of these assumptions do Ptolemy and Copernicus agree?   |  |  |                 |                               |                                |     |  |
|      | (a) The Earth must be the center of all motion in the Cosmos.  |  |  |                 |                               |                                |     |  |
|      | (b)  | All orbits must  | be perfect circles.                      |                 |                               |                                |     |  |
|      | (c) The Sun was bigger than the Earth.   |  |  |                 |                               |                                |     |  |
|      | (d)  | Venus must alv   | vays stay between us                     | and the Sun.    |                               |                                |     |  |
|      | (e)  | (e) The Sun must orbit us, but the planets do orbit the Sun. |  |                 |                               |                                |     |  |
| 105. | A fundamental difference between the Greeks (600-0 BC) and previous civilizations was the notion that the universe           |  |  |                 |                               |                                |     |  |
|      | (a)  | was big (b) (d) influenced of                                | was contained in a coour daily lives (e) | _               | (c) could be ed and wandering | completely understo<br>g stars | od  |  |
| 106. | The early astrophysicist who understood that the underlying cause of the elliptical orbits and falling apples is gravity was |  |  |                 |                               |                                |     |  |
|      | (a)  | Copernicus   | (b) Tycho Brahe                          | (c) Kepler      | (d) Galileo                   | (e) Newton                     |     |  |
| 107. | The was  | early astronom   | er who disproved the                     | e Ptolemaic sys | stem and was p                | unished by the chur            | ch  |  |
|      | (a)  | Tycho Brahe  | (b)Copernicus                            | (c)Kepler       | (d) Galileo                   | (e)Newton                      |     |  |
| 108. | The was  | early astronome  | er who agonized over                     | perfect (regul  | lar) solids while             | his mother sold dru            | ıgs |  |

|------|--|--|--|--|--|
| 124. | The modern way of measuring the AU involves bouncing radar off of  |  |  |  |  |
| 125. | Which concept was NOT a part of Kepler's Laws of Planetary Motion?   |  |  |  |  |
|      | (a) All planetary orbits are ellipses.   |  |  |  |  |
|      | (b) The square of the planet's period is equal to the cube of its average distance.  |  |  |  |  |
|      | (c) A planet must move fastest in its orbit at perihelion.   |  |  |  |  |
|      | (d) Epicycles are needed to explain the varying brightnesses of the planets.   |  |  |  |  |
|      | (e) The line that connects the Sun to Mercury sweeps out the same area in a month as does the line connecting us to the Sun. |  |  |  |  |
| 126. | Kepler's 1st law of planetary motion states that   |  |  |  |  |
|      | (a) planets orbit the Sun clockwise  |  |  |  |  |
|      | (b) orbits are non-circular  |  |  |  |  |
|      | (c) orbits are elliptical with the Sun at one focus  |  |  |  |  |
|      | (d) planets go faster with distance away from the Sun  |  |  |  |  |
|      | (e) planets spin in the same direction that they orbit   |  |  |  |  |
| 127. | Upon which point do Copernicus and Kepler disagree?  |  |  |  |  |
|      | (a) The Moon orbits the Earth.   |  |  |  |  |
|      | (b) The Earth orbits the Sun.  |  |  |  |  |
|      | (c) Retrograde motion occurs when one planet overtakes another.  |  |  |  |  |
|      | (d) The orbits of the planets are ellipses, with one focus at the Sun.   |  |  |  |  |
|      | (e) Venus will appear as a crescent when she retrogrades between us and the Sun.   |  |  |  |  |
| 128. | Which of these was not seen telescopically by Galileo?   |  |  |  |  |
|      | (a) sunspots   |  |  |  |  |
|      | (b) Venus' phase cycle   |  |  |  |  |
|      | (c) Four moons around Jupiter  |  |  |  |  |
|      | (d) stellar parallax   |  |  |  |  |
|      | (e) Craters and mare on the Moon   |  |  |  |  |
| 129. | The observation of Galileo that disproved the Ptolemaic model was  |  |  |  |  |
|      | (a) the Sun has spots  |  |  |  |  |

(b) Jupiter has its own satellites

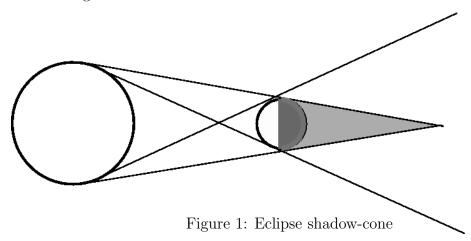

- (c) the Milky Way resolves into stars
- (d) Venus goes through a complete cycle of phases
- 130. Although Tycho came up with his own model of the Solar System, his most important contribution to the heliocentric revolution was
  - (a) his collaboration with Galileo (b) his meticulous observations of the planets as a political lobbyist (d) financial backing of Kepler (c)

## 1.5 Figures

- 131. (5pts) Draw a celestial sphere below for an observer at latitude 80 °N. Show the following:
  - i horizon (make it horizontal)
  - ii NCP and SCP
  - iii celestial equator (CE)
  - iv the Sun at noon on summer solstice
  - v N, S, E, and W
  - vi nadir and zenith

- 132. (4 pts) Use Figure 1 below for the following. Assume that the half-lit body represents the Earth and the large circle is the Sun. (The figure is not to scale.)
  - (a) Draw a point representing the Moon during a solar eclipse. Label it A.
  - (b) Draw a point representing the Moon during an total lunar eclipse. Label it B.
  - (c) Draw a point representing the Moon during an penumbral lunar eclipse. Label it C.
  - (d) Draw a point representing the Moon during a time when no lunar or solar eclipses are occurring. Label it D.

- 133. (4 pts) Use Figure 2 below to answer the following questions.
  - (a) Circle the Moon position which would exist during a solar eclipse. Label it "a".
  - (b) Write the time under observer # 2?
  - (c) Circle the Moon which is just setting at noon? Label it "c".
  - (d) Which phase would anyone on Earth observe when the Moon is in position "F" (e.g., waxing crescent, waning crescent, waxing gibbous, waning gibbous)?

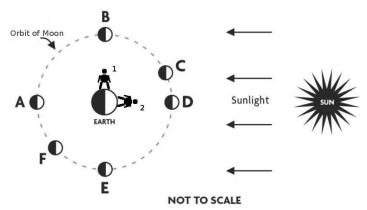

Figure 2: Moon Phases
